When planting in a rock garden, use some of the tall growing varieties for background, such as the American and Pyramid Arbor Vitae, Austrian and Scotch Pine, Norway Spruce and Canadian Hemlock.			When planting a shade tree cut back top branches one-half. Dig the hole deep and fill with water which should be al- lowed to settle. Set tree deep and tamp hard with foot. After tree is planted water again. Then water about twice a week for a month if in sandy soil. Less watering is required in heavy soil. Some varieties of trees will drown if watered too much.			BLACK DIRT		
The Junipers and Arbor Vitaes can be trimmed to prevent spreading or grow- ing too tall.			Our black dirt is nearly all humus. Humus is decayed vegetation and decayed vegetation is nature's fertilizer. Nothing of importance will grow without it. De- cayed vegetation produces a rank growth of new vegetation wherever used, in flower pots, window boxes, flower beds, gardens or lawns.			Two-yard truck load.....\$4.00		
PERENNIALS IN BLOOM			Two-yard truck load		\$4.00	Sack.....25c		
Don't forget to visit the nursery dur- ing the month of June when thousands of perennials are in bloom, and in July and August when many varieties of Hardy Phlox are in bloom. A good display will be on hand each day from which to select.			Dirt properly mixed with humus and fertilizer for use in window boxes.			Sack.....50c		
ANNUALS IN BLOOM								
Many annuals are in bloom at the nur- sery during the summer months. If your garden is not complete, you can get Petunias, Verbenas, Bachelor's But- tons, Pinks, Marigolds, Lobelias, Snap- dragons, Zinnias, etc., all in bloom, just what you need to fill up that vacant space in the garden.								
The nursery is open every day all sum- mer. The summer planting of flowers is increasing each year. The plants should be planted in late afternoon or evening for best results. Water the ground before planting and again afterwards. Press earth firmly around roots.								
Perennials should be protected in win- ter with a covering of three or four inches of straw. Cover in the fall when the ground starts to freeze.								

This is a view in one of the rock gardens at the nursery. It was taken in September, 1932, a few weeks after the garden was completed. There are about one hundred feet of irregular shore line around this pool. The garden can be viewed from any direction as a path leads entirely around the pool. This pool is fed by a winding stream flowing over waterfalls and through mossy banks from the pool of a smaller garden at a much higher elevation.

ROCK GARDENING AS A PASTIME

If you must have a hobby, try your hand at rock gardening. There is always something in nature that appeals to everyone. A rock garden built to represent nature is most fascinating. There is something in a well-built rock garden to interest everyone, the plants and flowers, the rocks, the water, water plants and fish, or the effect of the entire arrangement of the pool and the garden. Hills and valleys, streams and waterfalls representing in miniature what we have seen in nature make a grand display.

One might travel for days, and not find a spot so interesting as a carefully built rock garden on his own home grounds.

IT IS EASY TO MAKE A ROCK GARDEN

A rock garden should be something besides just a load of rock dumped on the ground with a little dirt thrown in between the rocks and a few plants added. To be fascinating a rock garden should represent something in nature. Who would care to see meadows and prairies covered with rock? But if we visit the mountains or steep banks of rivers or

lakes and fail to find ledges of rocks and boulders of all kinds, we would be disappointed.

It is on the mountain slopes and cliffs where we find the Alpine or rock plants growing, so let us make some mountains and valleys in miniature. If you wish a pool make it irregular to represent a lake with an island or peninsula, etc. Select a spot near the side or back of the lot line. Use some shrubs or evergreens for a background. Dig the pool about 18 to 24 inches deep, and cement the bottom and sides 4 to 5 inches thick. Use the dirt to shape the mountains and valleys around the pool. Leave enough open space in front for entrance to pool.

If the dirt is clay, add some sand or gravel to it, then mix in about 3 or 4 inches of our humus or peat soil. It supplies fertility and prevents the soil from washing. Dig pockets here and there and set your rock. Some prefer imported rock, but native rock is all right. Use the flat rock for cliff effect, boulders and odd shaped rocks on the slopes and foot hills. Then tamp the soil down between the rocks and set in the plants. Use some of the taller varieties near the pool.

Before starting your rock garden practice on a few tiny ones for models to get the shape you want. It will save time and produce some interesting results.
